## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Parry et al. (USP 6215435) in view of Okada (JP 10233636).

As to claim 1, Parry et al. discloses in figure 5A a circuit comprising: an amplifier (50) for receiving and amplifying a differential analog input signal at a high voltage level containing current sense information; a pulse width modulator circuit (56, 58) for converting the differential analog input signal to a pulse width modulated signal at the high voltage level; a level shifter circuit (53, the p-transistors, and the resistors) for converting the pulse width modulated signal from high voltage level to a low voltage level (output of the transistors and resistors). Thus, figure 5A shows all limitations of the claim except for "the amplifier circuit includes a circuit to minimize inherent temperature offset drift". However, Okada's figure 1 shows an amplifier (1) having circuit (2) to minimize inherent temperature offset drift". Therefore, it would have been obvious to one having ordinary skill in the art to use Okada's amplifier 1 for Parry et al.'s amplifier 50 for the purpose of improving the circuit performance.

As to claim 2, Okada's figure 3 shows that the circuit to minimize inherent temperature offset drift comprises a pair of mirrored MOSFETs (Tr2, Tr3), such that the circuit has an offset

Application/Control Number: 10/750,526

Art Unit: 2816

voltage which is equal to the difference between the gate-to-source voltage of the MOSFETs and remains constant over temperature variations.

As to claim 3, the modified Parry et al.'s figure 5A shows that the level shifter circuit comprises a pulse generator circuit (53) for producing rising edge triggered pulses and falling edge triggered pulses from the pulse width modulated signal and a pair of MOSFET (the p-channel FETs) for receiving the rising edge trigger pulses and the falling edge trigger pulses and transposing those pulses from a high voltage level to a low voltage level.

As to claim 4, Okada's figure 3 shows a high side current reference circuit (R1).

## Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. These references are cited as interest because they show some circuits analogous to the claimed invention.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Quan Tra whose telephone number is 571-272-1755. The examiner can normally be reached on 8:00 A.M.-5:00 P.M..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Timothy Callahan can be reached on 571-272-1740. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
